The invention provides an isolated polynucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal coperativaly linked to ITRS and a photoreeptor-specific promocer. A recombinant AV vector (AVV) comprising the polynucleotide is useful for tereating an ocular disease, e.g., retinal control occidence control occid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300
                          e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repeat
sequences, packaging signal and photoreceptor-specific promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

> sequences, adenovirus packaging signals operatively linked to the sequences and photoreceptor-specific promoters, useful for treating Novel nucleic acids comprising adenovirus inverted terminal repeat

Example 1; Page 62; 106pp; English.

The invention describes an isolated mucies and alphoroceptor-specific adenovirus inverted terminal repeat sequence, and a photoreceptor-specific signal operatively linked to the sequence, and a photoreceptor-specific signal operatively linked to the sequence, and a photoreceptor-specific for targeted delivery of a gene product to the eye of a mammal which involves administering (II) that comprises heterologus DNA encoding the crecombinant virus comprises a fibre protein that specifically or selectively binds to receptors that are expressed on cells which are photoreceptors in the eye. The recombinant virus comprises a fibre protein which is an adenovirus type 37, from an adenovirus type 10 serotype. The fibre is a chimeric protein containing a sufficient portion of the N-terminus of an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus type 2 or type 5 fibre protein for of the N-terminus of an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus type 2 or type 5 fibre protein for of the N-terminus of an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus type 2 or type 5 fibre protein for contrion of an adenovirus type 2 or type 5 fibre protein for a selective binding to photoreceptors in the eye of a mammal. The contrion of an adenovirus factor, and selective binding to photoreceptors in the eye of a mammal. The coperatively linked to a nucleic acid comprising the therapeutic product operatively linked to a nucleic acid comprising the therapeutic product concer agent and a protein that regulates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an ocular disease such as retinal degenerative disease e.g., retinitis coular diseases uch as retinal degenerative disease e.g., retinitis coular diseases. The viral nucleic acid comprises an adenovirus diseases in the viral nucleic acid comprises an adenovirus retinity and any adenovirus in the ethorogeneral product. The degenerative disease such as r inverted terminal repeat (ITR) sequences, and an adenovirus packaging signal operatively linked to the sequence. The ITRs and packaging signal are derived from an adenovirus serotype B or C, or adenovirus type 2 or photoreceptor-restricted transgene expression. This sequence represents TPL (tripartite leader sequence) from the adenovirus type 5 genome, used are derived from an adenovirus serotype B or C, or adenovirus type 2 or 5. The viral nucleic acid further comprises a photoreceptor-specific promoter. (II) includes photoreceptor promoters providing a means not only for specific targeting of expression in these cells, but also for The invention describes an isolated nucleic acid (I) comprising enhance the expression of complementing adenoviral proteins.

Novel isolated nucleic acid molecule useful for delivering heterologous gene to human or any animal, or for producing gutless adenoviral vector WPI; 2003-843463/78.

The invention describes an isolated mucleic acid molecule (I) comprising an adenovirus tripartite leader (TPL) nuclectide, the TPL nuclectide an adenovirus tripartite leader (TPL) nuclectide, the TPL nuclectide an adenovirus tripartite leader (TPL) nuclectide exons or first, second and third same or different TPL exons chosen from the complete or partial TPL exon 1. Complete TPL exon 2 and complete TPL exon 3. (I) is useful for delivering a patterologous gene to a human or any animal, or for producing a gutless adenoviral vector particle. A recombinant adenovirus particle (II) is useful for delivery of an exogenous gene to a target cell which involves contacting the cell with an adenovirus vector genome (III) is useful for producing an adenovirus vector particle containing (III) is useful for producing an adenovirus vector particle containing (III) which involves (III) is useful for packaging of the genome and (III) which is deficient in expressing of the genome and (III) which is deficient in expressing of the genome and (III) which is deficient in expressing sufficient functional fiber protein to support assembly of fiber containing particles and harvesting the particle produced by the cell involves complementing a missing fiber gene of (III) or helper-dependent fiber gene from a different adenovirus vector genome by expressing in packaging cells a fiber gene from a different adenovirus vector to a cell of choice. (I) is useful for recombinant adenovirus vector to a cell of choice. (I) is useful for recombinant adenovirus vector to a cell of choice. (I) is useful for cecombinant particle leader sequence represents a partial adenovirus containing diseases such as hereditary condisored to disrupt HIV infection. This sequence represents a partial adenovirus equence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

The present sequence is that of a pCLF plasmid used in the method of the invention. The pCLR plasmid ass derived from the pCDNA3/Fibrar plasmid (AAV32371) containing an additional adenovirus type 2 (AD2) tripartite leader sequence to enhance expression. The pCLF plasmid also contains an adenovirus type 5 (AD2) fiber gene controlled by a CMV promoter and a neo cresistant gene. The invention provides adenoviral vectors having adenovirus type 5 (AD2) fiber gene controlled by a CMV promoter and a neo cresistant gene. The invention provides adenoviral vectors having deletions of all or part of various gene sequences encoding adenoviral structural proteins and/or early region proteins. Deletions in these proteins and/or early region proteins. Deletions in these content and the structural and/or early gene regions are produced by of diagnostic and therapeutic applications. The adenoviral vectors having deletions in the structural and/or early gene regions are produced by cellular complementation of these adenoviral genes. Therefore, the pCLF plasmid was used as a complementation plasmid which was introduced into a host cell line where parts of the fiber gene region would be stably characterised by hyper-proliferative cells (e.g. tumours), genetic characterised by hyper-proliferative cells (e.g. tumours), genetic diseases (e.g. Huntington's disease, Tay-Sachs disease, or sickle cell disease), or infections (e.g. HIV infection). They can also be used for in vitro production of biologically active proteins. (Updated on 25-MAR-

The nucleic acid is used to produce an adenovirus vector particle, deliver an exogenous gene to a target cell, pseudotype recombinant viral vectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a gutless adenovirus vector particle. The present sequence represents a partial TPL sequence, which is used to construct nucleic acid molecules of the invention. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nucleic acid comprising an adenovirus tripartite leader nucleotide producing high-capacity and targeted vectors for adenovirus-based

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides an isolated polymucleotide comprising adenovirus (AV) inverter terminal repeat sequences (ITRS), AV packaging signal operatively linked to ITRS and a photoreceptor-specific promoter. A recombinant AV vector (AVV) comprising the polymucleotide is useful for trargeted delivery of a gene product to the eye (especially to the vitreous cavity), for treating an ocular disease, e.g., retinal degenerative disease, retinitis pigmentosa, Stargardt's disease, diabetic

preferably human. The AAV comprises a fiber protein that specifically or selectively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a fiber protein from an adenovirus type D subgroup or is a chimeric protein containing a portion of the N-terminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anti-apoptotic factor, gene encoding a rhodopsin protein, a wild-type stargardt disease gene (STDG1), an anti-cancer agent and a protein that regardt disease gene (STDG1), an anti-cancer agent and a protein that nucleic acid of AAV comprises ITRS and packaging signal derived from AAV subgroup B or C, especially an AV type 2 or type 5. AAV is also useful for targeted gene therapy, where the vector comprises an AV type 37 fiber protein or its portion, and selectively transduces photoreceptors and delivers a gene product encoded by AAV. The present sequence represents an expression plasmid pCLF containing the adenovirus 5 fiber gene

control operatively linked to the sequence, and a photoreceptor-specific adenovirus inverted terminal repeat sequence, and a photoreceptor-specific promoter. A Recombinant adenovirus vector (II) comprising (I) is useful corrected delivery of a gene product to the eye of a mammal which is involves administering (II) that comprises heterologous DNA encoding the gene product or reculting in expression of the gene product, where the gene product or reculting in expression of the gene product, where the cerombinant virus comprises a fibre protein that specifically or selectively binds to receptors that are expressed on cells which are photoreceptors, in the eye The recombinant virus comprises a fibre correction which is an adenovirus type 37, from an adenovirus type D serotype. The fibre is a chimeric protein containing a sufficient portion of the fibre is a chimeric protein containing a sufficient portion of an adenovirus type 2 or type 5 penton, and a sufficient portion of an adenovirus type 2 or type 5 penton, and a sufficient portion of an adenovirus serotype D knob portion of the fiber for encapsulated nucleic acid comprises a photoreceptor-specific promoter operatively linked to a nucleic acid comprising the therapeutic product which is chosen from trophic factor, anti-apoptotic factor, gene encoding a rhodopsin protein, wild-type Stargardt disease gene (STDG1), an anti-cancer agent and a protein that requires expression of a photoreceptor-specific gene product. The disperse tripopatises and adenovirus packaging signal operatively linked to the sequence. The ITRs and packaging signal are derived from an adenovirus serotype B or C, or adenovirus packaging signal are derived from an adenovirus serotype B or C, or adenovirus packaging are product transminal repeat (ITR) sequences, and adenovirus packaging are product transmined from an adenovirus serotype B or C, or adenovirus proper or photoreceptor-reprices or adenovirus second transment each or restricted for transgent each or proper each or restricted transge pnotoreceptor-restricted transgene expression. This sequence represents plasmid comprising an adenovirus fibre gene under the control of a The invention describes an isolated nucleic acid (I) comprising cucmber mosaic virus (CMV) promoter.

coordenous gene to a target cell which involves contacting the cell with an amount of (II) sufficient to infect the cell. A helper-independent fiberless recombinant adenovirus vector genome (III) is useful for producing an adenovirus vector particle containing (III) which involves provaining a packaging cell line which complements replication and packaging of the genome and (III) which is deficient in expressing sufficient functional fiber protein to support assembly of fiber containing particles and harvesting the particle produced by the cell involves complementing a missing fiber gene of (III) or helper-dependent convolves recombinant adenovirus vector genome by expressing in packaging cells a fiber gene from a different adenoviral serotype than the recombinant adenovirus vector genome by expressing in packaging cells a fiber gene from a different adenoviral serotype than the recombinant adenovirus vector (III) is also useful for specifically targeting an adenovirus vector to a cell of choice. (I) is useful for gene therapy. (II) is useful for treating diseases such as hereditary disorder, and for reducing proliferation of tumour cells in a subject, or cultaritic leader sequence added to plasmid poly. (C) gene-deleted adenovirus expressing plasmid for complementation of E4-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1028 GAGCGAGTCCGCATCGACCGGATCGGAAAACCTCTCGAGAAAGCGCGTCTAACCACAACA 1087

20-JUL-2000.

Nucleotide sequence of the E4/fiber-expressing plasmid pE4/Fiber.

```
The present sequence is that of a pE4/Fiber plasmid used in the method of the invention. The plasmid contains an adenovirus type 5 (AD5) fiber gene controlled by a CMV promer, an AD5 Ed gene and an adenovirus type 2 (AD2) tripartite leader sequence upstream of the fiber gene. The controlled by a CMV promer, an AD5 Ed gene and an adenovirus type 2 (AD2) tripartite leader sequence upstream of the fiber gene. The covarious gene sequences encoding adenoviral structural proteins and/or early region proteins. Deletions in these proteins would allow a reduced cover isk of wild-type virus contamination and would also allow packaging of coreign DNA in such vectors for a variety of diagnostic and therapeutic applications. The adenoviral vectors having deletions in the structural and/or early gene regions are produced by cellular complementation of these adenoviral general produced by cellular complementation of these adenoviral generally rectors having deletions in the structural complementation plasmid which was introduced into a host cell line where parts of the fiber and E4 gene region would be stably inserted into the parts of the fiber and E4 gene region would be stably inserted into the complementation plasmid which was introduced into a host cell line where complement and E4 gene region would be stably inserted into the part of the fiber and E4 gene region would be stably inserted by presence or gene therapy, e-g. for treating conditions characterised by hypercorporal referance cells (e-g. tumours), genetic diseases (e-g. Huntington's clisease, Tay-Sachs disease, or sickle cell disease), or infections (e-g. Hiv infection). They can also be used for in vitro production of the production of the production of the parts of the parts of the parts of the parts of the production of the parts of the parts
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Adenoviral vectors - which lack DNA encoding for structural protein or fibre protein used particularly for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 10610 BP; 2807 A; 2821 C; 2446 G; 2536 T; 0 U; 0 Other;

4109 CAGTACTCTTGGATCGGAAACCCGTCGGCCTCCGAACGGTACTCCGCCACCGAGGGACCT 4168 The specification describes a nucleic acid molecule comprising an adenovirus (AV) tripartite leader (TPL) nucleotide with a sequence comprising two different TPL exons or three same or different TPL exons. The nucleic acid is used to produce an adenovirus vector particle, 4049 GATCTGAATTCGAGCTCGCTGTTGGGCTCGCGGTTGAGGACAAACTCTTCGCGGTCTTTC 2 GATCTGAATTCGAGCTCGCTGGTTGGCGTTGAGGACAAACTCTTCGCGGTCTTTC 62 CAGTACTCTTGGATCGGAAACCCGTCGGCCTCCGAACGGTACTCCGCCACCGAGGGACCT deliver an exogenous gene to a target cell, pseudotype recombinant virvectors, target an adenovirus vector to a cell, produce a modified adenovirus, deliver a heterologous gene to an animal and produce a quiless adenoviral vector particle. The present sequence represents pE4/Fiber, a complementing plasmid containing E4 and fiber Adenoviral Gaps Sequence 10610 BP; 2807 A; 2821 C; 2446 G; 2536 T; 0 U; 0 Other; ö 99.4%; Score 325; DB 3; Length 10610; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides an isolated polynucleotide comprising adenovirus operatively linked to ITRS and a photoreceptor-specific promoter. A recombinant AV vector (AVV) comprising the polynucleotide is useful for targeted delivery of a gene product to the eye (especially to the vitreous cavity), for treating an ocular disease, e.g., retinal degenerative disease, retinitis pigmentosa, Stargard's disease, diabetic retinopathies, retinal vascularizations, and retinoblastoma, of a mammal preferably human The AAV comprises a fiber protein that specifically or selectively binds to receptors that are expressed on cells (preferably photoreceptors in the eye). Preferably, the recombinant virus comprise a fiber protein from an adenovirus type D subgroup or is a chimeric protein containing a portion of the N-terminus of an adenovirus type 2 or type 5 penton, and the therapeutic product is a trophic factor, an anti-
                                                                                                            301
                                                             241
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polynucleotide for making vectors, useful for treating ocular diseases, e.g., retinitis pigmentosa, comprises adenovirus inverter terminal repeat sequences, packaging signal and photoreceptor-specific promoter.

apoptotic factor, gene encoding a rhodopsin protein, a wild-type stargardt disease gene (STDG1), an anti-cancer agent and a protein that regulates expression of a photoreceptor specific gene product. The viral nucleic acid of AAV comprises ITRS and packaging signal derived from AAV subgroup B or C, especially an AV type 2 or type 5. AAV is also useful for targeted gene therapy, where the vector comprises an AV type 37 fiber protein or its portion, and selectively transduces photoreceptors and delivers a gene product encoded by AAV. The present sequence represents an expression plasmid p84/Fiber containing the adenovirus E4 and Fiber
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ophthalmological; antinflammatory; antidiabetic; gene therapy; adenovirus inverted terminal repeat sequence; adenovirus packaging signal; photoreceptor-specific promoter; adenovirus type 37; adenovirus type Decorptor; adenovirus type 5; photoreceptor; trophic factor; anti-apoptotic factor; andogosin; wild-type Stargardt disease gene; STDG1; anti-apoptotic factor; retinal degenerative disease; retinitis pigmentosa; Stargardt's disease; diabetic retinopathy; retinal vascularisation; choroideraemia; photoreceptor-restricted transgene expression; photoreceptor-restricted transgene expression; recombinant adenovirus vector; adenovirus type 5; p84/Fibre; plasmid;

```

```
The invention describes an isolated nucleic acid (I) comprising adenovirus inverted terminal repeat sequence, an adenovirus packaging condenovirus inverted terminal repeat sequence, and aphororeceptor-specific promoter. A Recombinant adenovirus vector (II) comprising (I) is useful for targeted delivery of a gene product to the eye of a mammal which comprisives beterologous DNA encoding the gene product or resulting (II) that comprises heterologous DNA encoding the gene product or receptors that are expressed on cells which are recombinant virus comprises a fibre protein that specifically or comprises, in the eye. The recombinant virus comprises a fibre protein which is an adenovirus type 37, from an adenovirus type D to protein which is a chimmeric protein containing a sufficient portion of the N-terminus of an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus type 2 or type 5 fibre protein for interaction with an adenovirus serotype D knob portion of the fibre for comprises a photoreceptor specific promoter selective binding to photoreceptors in the eye of a mammal. The encapsulated nucleic acid comprising the therapeutic promoter compensatively linked to a nucleic acid comprising the therapeutic promoter which is chosen from trophic factor, anti-apoptotic factor, gene encoding a rhodopsin protein, wild-type stargardt disease gene (STDGI), an anti-concent agent and a protein that regulates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an encled specific gene product. The delivery is effected for treatment of an event and a protein that regulates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an event and a protein that regulates expression of a photoreceptor-specific gene product. The delivery is effected for treatment of an event of specific acid comprises in the event and acquired and acquired at extinoplastions inherited and acquired retinal and neovascular degenerative diseases. The v
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 122 GAGCGAGTCCGCATCGACCGGATCGGAAACCTCTCGAGAAAGGCGTCTAACCAGTCACA 181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           can be

```
The invention describes an isolated nucleic acid molecule (I) comprising an adenovirus tripartice leader (TPL) nucleotide, the TPL nucleotide sequence comprising a first and second different TPL exons or first, second and third same or different TPL exons, the TPL exons chosen from complete or partial TPL exon 1, complete TPL exon 2 and complete TPL exon 2 and complete TPL exon 3. (I) is useful for delivering a heterologous gene to a human or any animal, or for producing a gutless adenoviral vector particle. A recombinant adenovirus particle (II) is useful for delivery of an exogenous gene to a target cell which involves concacting the cell with an amount of (II) sufficient to infect the cell. A helper-independent fiberless recombinant adenovirus vector genome (III) is useful for producing an adenovirus vector particle containing (III) which involves producing a packaging cell line which complements replication and packaging the genome and (III) which is deficient in expressing sufficient functional fiber protein to support assembly of fiber

containing particles and harvesting the particle produced by the cell line. [III] is useful for pseudotyping recombinant viral vectors which involves complementing a missing fiber gene of [III] or helper-dependent fiberless recombinant adenovirus vector genome by expressing in packaging cells a fiber gene from a different adenoviral serotype than the recombinant adenovirus vector. [III] is also useful for specifically targeting an adenovirus vector to a cell of choice. [I] is useful for equence the range therapy. [II] is useful for treating diseases such as hereditary disorder, and for reducing proliferation of tumour cells in a subject, or to disrupt HIV infection. This sequence represents the complementing plasmid pB4/fibre that expresses the adenoviral E4 and fibre genes.

The present sequence is that of a pEI/Fiber plasmid used in the method of the invention. The plasmid contains an adenovirus type 5 (AD5) fiber gene controlled by a CMV promoter, an AD5 I gene and a pMAM backbone. The invention provides adenoviral vectors having deletions of all or part of various gene sequences encoding adenoviral structural proteins and/or early region proteins. Deletions in these proteins would allow a reduced risk of wild-type virus contamination and would also allow packaging of creign DNA in such vectors for a variety of diagnostic and therapeutic applications. The adenoviral vectors having deletions in the structural and/or early gene regions are produced by cellular complementation of these adenoviral genes. Therefore, the pEI/Fiber plasmid was used as a complementation plasmid which was introduced into a host cell line where parts of the fiber and El gene region would be stably inserted into the host cell chromosomes. The resulting El/fiber gene deficient plasmid can be used as a gene delivery vector. The vectors can be used for diagnosis or gene therapy, e.g. for treating conditions characterised by hypercy proliferative cells (e.g. tumours), genetic diseases (e.g. Huntington's diseases, Tay-Sachs disease, or sickle cell diseases), or infections (e.g. HIV infection). They can also be used for in vitro production of the piologically active proteins. (Updated on 25-MAR-2003 to correct PI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    13315 GATCTGAATTCGAGCTCGCTGTTGGGCTCGCGGTTGAGGACAAACTCTTCGCGGTCTTTC 13256

ABRC Stock Number CS826573; T-DNA left border flanking sequences of
Syngenta Arabidopsis Insertion Library (SAIL) lines are available
through the Arabidopsis Biological Resource Center (ABRC).
Sequences represent a pool of amplified genomic regions and not
single contiguous sequences.
Class: TDNA tagged.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ORGANISM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     REFERENCE

Sequences represent a pool of amplified genomic regions and single contiguous sequences.
Class: TDNA tagged.
